

Outcome coding: trajectories the harness could not score are excluded. A shows paired differences vs. baseline with 95% paired-bootstrap intervals and the sample size for each contrast. Random control is a single isotropic direction fixed in advance (seed 20260911) at matched intervention norm, not a set; treat it as one draw. Benign and norm-matched panels show absolute rates with Wilson intervals. C uses the 45 prompts scoreable under both equal-norm conditions, so the bars match the paired annotation; the primary baseline is shown elsewhere as descriptive context only, with no baseline rerun.
