

Residual steering retains Tool classification despite increased attack success

● Simulated upload completed    ● No simulated upload    ✕ Not scoreable by harness

One point per prompt-condition, read out immediately after the page fetch and before the trajectories diverge. The x-coordinate is the actual margin; vertical jitter is cosmetic. Dashed line is the probe's decision boundary: points to its left are text the probe still classifies as Tool. Points cover every prompt (48 / 24 / 24 / 48), including trajectories the harness could not score. Bold percentages use the smaller common-evaluable samples (37 / 20 / 18 / 45), so they are not simply the blue fraction of the dots shown. Outcome coding: trajectories the harness could not score are excluded. Equal-norm panel has no baseline arm of its own.
